Defining the Platform

A platform is a technology-based intermediary that enables interactions between two or more distinct user groups. It provides a shared infrastructure and set of tools that facilitate the exchange of goods, services, or information. Unlike traditional businesses, platforms focus on

creating value through the connections they establish rather than through direct sales or production.

Key attributes of platforms include:

- **Intermediation:** Platforms facilitate interactions between users who would not otherwise connect.
- **Network Effects:** As more users join a platform, its value increases for all participants.
- **Two-Sided Markets:** Platforms connect two distinct user groups, creating value for both sides.
- **Ecosystem Development:** Platforms attract third-party developers and partners who build complementary services, further enhancing the platform's value.

Value Creation in Platform Businesses

Platforms create value through a variety of mechanisms:

- **Transaction Facilitation:** Platforms reduce friction and facilitate transactions between users.
- **Data and Insights:** Platforms collect vast amounts of data, providing valuable insights to users and enabling personalized experiences.
- **Network Effects:** The more users join a platform, the more valuable it becomes for all participants. This creates a virtuous cycle of growth and value.
- **Innovation Ecosystem:** Platforms attract third-party developers who create complementary services and applications, extending the

platform's capabilities.
